BraveGen

IFS Growth is migrating its auditing and H&S management software to BraveGen. The key to the success of this project is it puts a number of H&S components into the smart phones and hands of field staff. This is where the action happens. Examples are field audits, actions that need follow up, incident reporting, consultations with neighbours, and sightings of rare and threatened species. From this list it is obvious that BraveGen also serves a critical role in the coordinated collection of field data for our FSC certification.

As folks carry out audits, suggested improvements to audits can be made quickly and the rollout and update happens automatically, as soon as people open BraveGen on their smartphones. The data captured in the field, off-the-grid, can be in the form of responses to questions, photographs, images and voice recordings.

BraveGen has a library function. This allows us to implement document control, where the most current versions of policies and procedures are readily available to all staff including field staff where-ever they are. This replaces files stored in multiple locations and in some cases multiple versions of the same files.

Really a system like BraveGen is taking H&S and FSC management away from the 100+ page manuals rattling around the back seat of the Ute and placing the main tools into the hands of office and field staff for use as the event happens.
